

1 **ABSTRACT OF THE DISCLOSURE**

2 A pulsating dental sprayer has a body and a turbine rotor. The body is
3 adapted to connect to a water source and has a handle and a spraying head. The
4 turbine rotor is rotatably received in the body and has a semicircular ring, a
5 semicircular top plate and multiple extension blades. The semicircular top cover
6 is attached to the ring to construct a circle in cooperation with the semicircular
7 ring. The extension blades are formed on and extend radially from the outer
8 periphery of the ring and the top cover. Accordingly, the sprayer can provide a
9 pulsating massage effect, and electrical power is not needed for use of the
10 sprayer.
